

CLEAN TECH
COMPETITION

2018 | **Solving Climate Change**

Our common goal:

To prepare the next generation of
environmental caregivers.

While we encourage you and your students to participate every year, the focus of this year's Clean Tech Competition is especially relevant. "Solving Climate Change" challenges students to take on the problems associated with climate change. This is an opportunity for us to work together to promote the integration of science, clean technology, math and engineering to help create a solution to this global problem.

Throughout the **Clean Tech Competition**, students will:

- thoroughly educate themselves on the causes and effects of a specific issue
- compile research and present a scientific report
- conceptualize a safe, sustainable, clean technology solution
- develop, test, and adjust a prototype or model of their design
- enhance their presentation skills, written and oral

Student teams may choose to focus on an issue relating any facet of the "Solving Climate Change" such as:

- Reducing carbon footprint
- Sea level rise
- Damage mitigation
- Reversing climate change
- Coastline relocation of people
- Related topic of their choice

Your students' skills and knowledge will be a vital asset in the development of a healthier, cleaner, greener world for the pursuit of a better tomorrow.
